

Two-Column Layout Test Document

Left column paragraph one. This text should be detected as belonging to the left column by the KMeans clustering algorithm that analyzes x0 coordinates of bounding boxes.

Left column paragraph two. The column detection works by clustering the x-coordinates of text boxes and selecting the optimal number of clusters using silhouette scoring.

Right column paragraph one. This text occupies the right-hand column and should be assigned a different column ID than the left column.

Right column paragraph two. Multi-column PDFs are common in academic papers, newspapers, and technical documentation. Correct column detection is essential for maintaining reading order.

Right column paragraph three. After column detection, text within each column is merged vertically before interleaving columns.
