

Three-Column Newsletter Layout

COLUMN ONE HEADING
KMeans should detect three
x0 clusters. First column
boxes get col_id=0.

Text is merged vertically
within each column before
reading-order interleave.

COLUMN TWO HEADING
The middle column should
receive col_id=1 from
the KMeans clustering.

Three-column layouts are
common in newsletters and
some academic journals.

COLUMN THREE HEADING
The right column receives
col_id=2. All columns are
then processed in order
to produce the final text
with correct reading order
for downstream RAG use.

Three-Column — Page 2

Page 2 column one continued.
Cross-page column assignments
should remain consistent.

Page 2 column two continued.
Testing multi-page column
detection stability.

Page 2 column three continued.
Persists across page breaks.
